

### Visual Proof Answer Key: AA Similarity Theorem

Given two triangles  $\triangle ABC$  and  $\triangle DEF$  such that  $\angle A \cong \angle D$  and  $\angle B \cong \angle E$ . Prove that  $\triangle ABC$  is similar to  $\triangle DEF$ .

Proof:

By definition of congruence, since  $\angle B \cong \angle E$ , there exists a sequence of translations, rotations, and reflections that sends  $\angle B$  to  $\angle E$ .

There is a choice of where the point  $D$  is sent. Since an angle, by definition, is two rays with a common endpoint,  $D$  must be sent to one of the two rays connected to  $B$ : Either ray  $BA$  or ray  $BC$ . Choose a transformation  $T$  that sends  $D$  to the ray  $BA$ . Since  $F$  is on the other ray of  $\angle E$ ,  $T(F)$  will be on ray  $BC$ . Here is the picture: (note it is possible that  $T(D)$  and  $T(F)$  are on the outside of  $ABC$ , this is fine, the rays continue to infinity).

Now let  $S$  be a dilation with center  $B$  and scale factor  $|BA|/|BT(D)|$ .

By definition of dilation, the point  $T(D)$  is sent by  $S$  to point  $A$ .

Dilations preserve angles, so that implies that ray  $T(D)T(F)$  is sent to ray  $AC$ .

We do not know that  $S$  sends  $T(F)$  to point  $C$ . We still need to prove that. This look like:

Notice that  $\angle B \cong \angle S(T(E))$  and  $\angle A \cong \angle S(T(D))$  and segment  $AB \cong$  segment  $S(T(E))S(T(D))$ . To weed through all the letters, here is the picture with the relevant parts in color with the rest grayed out:

Here we see that we have two triangles  $\triangle ABC$  and  $\triangle S(T(D))S(T(E))S(T(F))$  that have two angles congruent and the contained side congruent. Therefore, by Angle-Side-Angle Congruence Theorem,  $\triangle ABC \cong \triangle S(T(D))S(T(E))S(T(F))$

Unpacking what we have done, and noting that  $\triangle S(T(D))S(T(E))S(T(F)) = S(T(\triangle DEF))$ , we see that :

There is a sequence of congruence transformation and dilations that map  $\triangle DEF$  to  $\triangle ABC$ . Therefore, by *definition of similarity*,  $\triangle ABC$  is similar to  $\triangle DEF$ .
